ABSTRACT

There is provided a connection unit for a data recording device adapted to readily attach a connector electrically connected to another device to connection terminals of the data recording device and detach it therefrom. A connection unit [[1]] for a data recording device [[5]], including a base [[10]] and a connector [[51]] fixed to the base [[10]], and for connecting to the connector [[51]] the thin data recording device [[5]] of a cuboid shape and with a plurality of connection terminals [[5a]] arranged at one side [[5e]] of the device [[5]], wherein the base [[10]] includes a receptacle [[31]] being movable along a direction heading for the connector [[11]] with accommodating the data recording device [[5]], and wherein the receptacle [[31]] is adapted to hold the device [[5]] by pressing both sides [[5b and 5c]] of the device [[5]] along the direction in which the receptacle [[31]] moves upon application of pushing force to the receptacle [[31]] toward the connector [[51]], so as to move with adjusting the device [[5]] in a position corresponding to a position where the connector [[51]] is fixed, so that the connection terminals [[5a]] are connected to the connector [[51]].
